

Project checkpoint: align your capstone direction

1. Show current evidence

- Dataset and recommendation task
- Evaluation split and top-K metrics
- Baseline result or first sanity check
- One insight from your current results

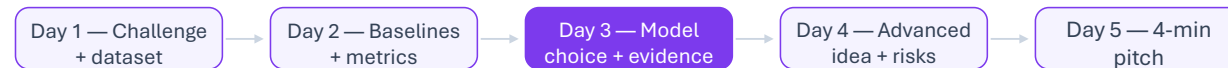

2. Decide today

- Which limitation matters most?
- Does the project need a deep model?
- Which model family fits the data?
- What baseline must it outperform?

3. Update before leaving

- One short checkpoint note
- One result table or screenshot
- One risk, blocker or support need
- Next experiment for tomorrow

Daily alignment rhythm

Template: Dataset → baseline → limitation → next experiment
